CONCLUSION	73

INTRODUCTION

This study presents the Culture Index of Municipalities for the year 2022. Notably, Kaunas held the title of European Capital of Culture, while Alytus claimed the designation of Lithuanian Capital of Culture. An exciting development is the ongoing construction of the Stasys Eidrigėvičius Arts Centre in Panevėžys. It will be intriguing to observe how these initiatives influence the overall performance of the Culture Index of Municipalities.

The previous year's index underscored the relatively low level of funding for cultural services in major cities. It raises the question: Is funding increasing, remaining stable, or possibly decreasing? Additionally, the 2022 Index can be updated with new data on citizens' participation in culture and their satisfaction with cultural services (KOG institutas, 2024). Are people more inclined to engage in cultural activities and experience heightened creativity on an individual level? This study aims to address these questions.

The aim of the Municipal Culture Index is to objectively and comprehensively represent the cultural situation in each municipality, facilitating comparisons both between municipalities and over time. It is designed to enable the identification of the most problematic aspects that could be improved within each municipality.

However, I consider the motto 'Municipalities in the process of creating' to be the essence of the Municipal Culture Index. This notion has been previously discussed in the Municipal Culture Index 2021 research report (Mažeikaitė, 2023), emphasizing the need for a fully functioning ecosystem to foster culture. In this ecosystem, every participant plays a crucial role: cultural policymakers and implementers, mayors, municipal administration teams, cultural organisations, artists, and citizens.

In a fully functioning cultural ecosystem, all parties are active. Targeted funding supports the development of culture and the arts, making culture accessible to all. Artists and cultural organisations strive for the highest level of professionalism, ensuring that the works they present are interesting, contemporary, relevant, and meaningful. Citizens actively attend and find value in cultural events. How can we achieve all this? I believe that each of us, as participants in the cultural ecosystem, can ask ourselves: What more can I do to make the cultural environment more diverse, significant, interesting, and accessible? And then, take action.

Finally, I hope we can engage in discussions about culture using numbers and facts, showing interest and curiosity in its exploration. May a comprehensive assessment of the cultural situation guide us towards the best possible solutions. Let's create!

1

DATA

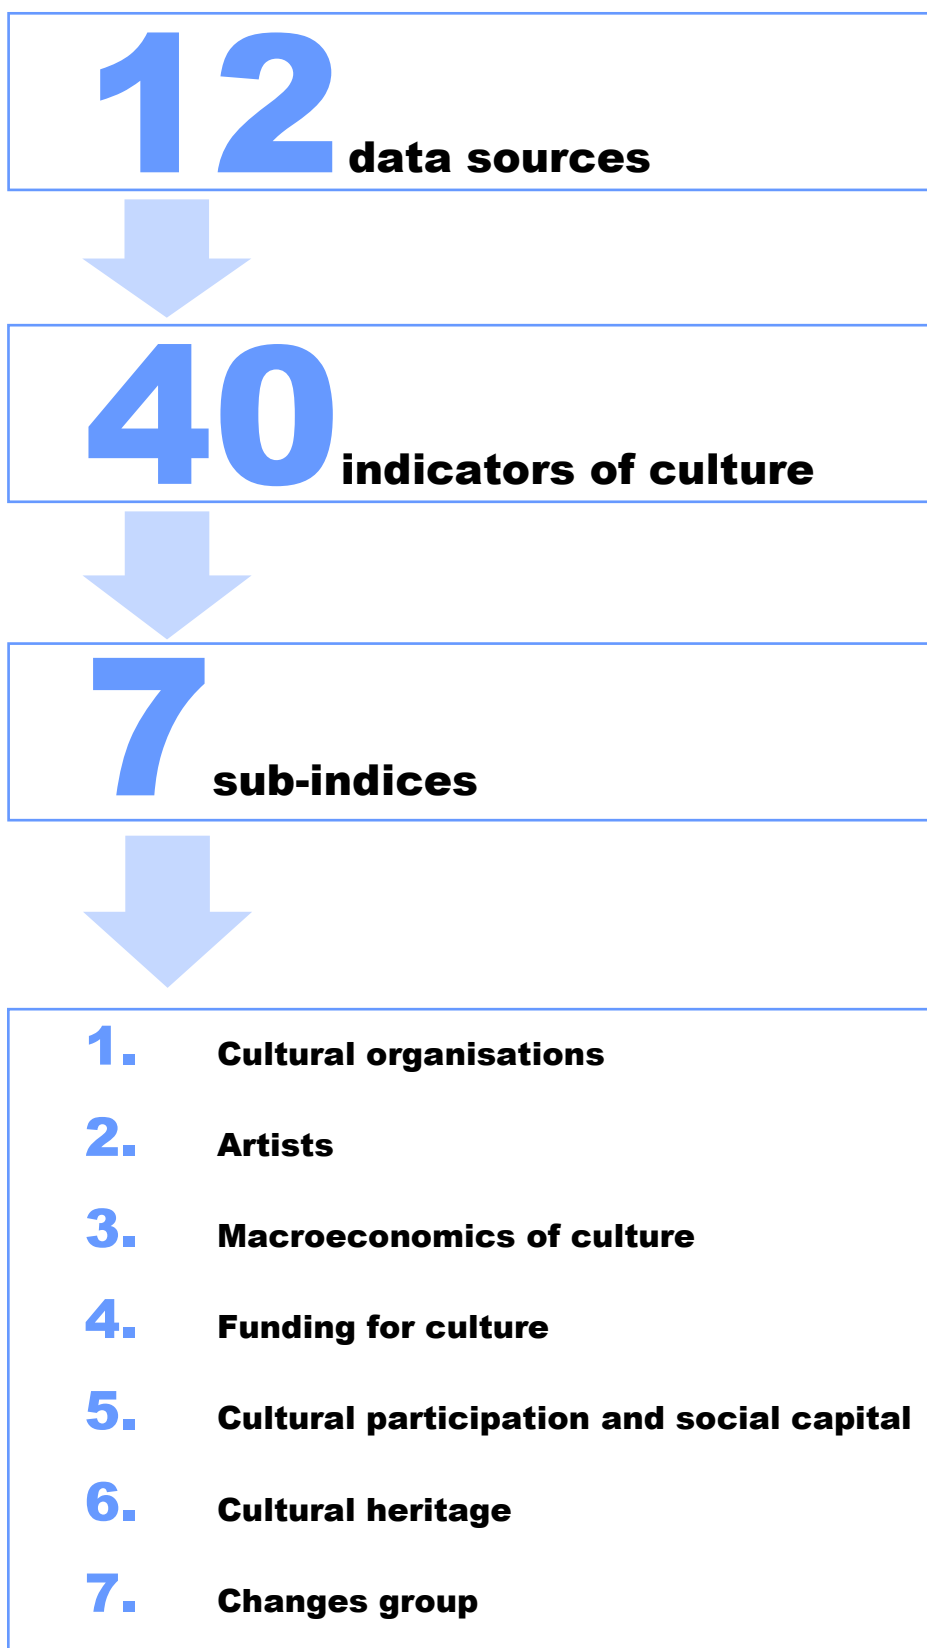

Figure 1 Structure chart of the Culture Index of Municipalities 2022 (compiled by the author)

The Culture Index of Municipalities is derived from 12 carefully selected data sources. The primary criteria for choosing these sources were their reliability, representativeness, and timeliness. The data sources for the Culture Index of Municipalities indicators include:

1. State Data Agency (Statistics Lithuania);
2. Sodra (The State Social Insurance Fund Board under the Ministry of Social Security and Labour);
3. Lithuanian Council for Culture;
4. Martynas Mažvydas National Library of Lithuania;
5. Lithuanian Artists Associations;
6. State Tax Inspectorate under the Ministry of Finance of the Republic of Lithuania;
7. Ministry of Finance of the Republic of Lithuania;
8. Ministry of Culture of the Republic of Lithuania, Kurk LT;
9. Survey of municipalities;
10. Citizens' participation in culture and satisfaction with cultural services (survey data);
11. Department of Cultural Heritage under the Ministry of Culture;
12. State Commission for Cultural Heritage.

A detailed list of indicators is given in Table 1.

Table 1 List of Municipal Culture Index (compiled by the author)

Sub-indices	N	Indicator
CULTURAL ORGANISATIONS	1	Number of cultural enterprises (by place of registration of the legal code) per 1,000 inhabitants
	2	Number of branches of cultural enterprises carrying out traditional cultural activities per 1,000 inhabitants
	3	Number of cultural enterprises engaged in new creative industries per 1,000 inhabitants
	4	Number of organisations in the non-budgetary sector per 1,000 inhabitants
	5	Number of libraries per 1,000 inhabitants
	6	Number of museums per 1,000 inhabitants
	7	Number of cultural centres per 1,000 inhabitants
ARTISTS	1	Number of professional artists per 1,000 inhabitants
	2	Number of amateur art collectives per 1,000 inhabitants

MACROECONOMICS OF CULTURE	1	Turnover of cultural enterprises performing traditional cultural activities, Eur/capita
	2	Turnover of cultural enterprises performing new creative industries activities, Eur/capita
	3	Expenditure on wages and salaries of employees by place of activity (traditional cultural activities; excluding employer's social security contributions), Eur/employee
	4	Expenditure on wages and salaries by place of activity (new creative industries activities; excluding employer's social security contributions), Eur/employee
	5	Number of employees by place of activity (traditional cultural activities) per 1,000 inhabitants
	6	Number of employees by place of activity (new creative industries activities) per 1,000 inhabitants
	7	Value added at production cost by place of activity (traditional cultural activities), Eur/capita
	8	Value added at production cost by place of activity (new creative industries activities), Eur/capita
FUNDING FOR CULTURE	1	Artists received Lithuanian Council for Culture funding, Eur per capita
	2	Municipal budget expenditure on cultural services, Eur per capita
	3	Share of municipal budgets' expenditure on cultural services in total expenditure, %
	4	Organisations received Lithuanian Council for Culture funding, Eur per capita
	5	Share of municipal budget funding for artists, Eur per capita
PARTICIPATION IN CULTURE AND SOCIAL CAPITAL	1	Number of participants in cultural centres per 1,000 inhabitants
	2	Number of museum visitors per 1,000 inhabitants
	3	Number of library users per 1,000 inhabitants
	4	Number of library visitors (visits) per 1,000 inhabitants
	5	Percentage of the population (≥ 15 years) that consumed cultural products/used cultural services in the last 12 months.
	6	Percentage of the population that participates in events promoting historical memory and considers civic and national identity as a value, %
	7	Percentage of people who would certainly describe themselves as a creative person.
	8	Percentage of people who strongly agree that it is beneficial for a society to be culturally diverse.
	9	Percentage of the population satisfied with the availability of cultural services
CULTURAL HERITAGE	1	Number of cultural heritage monuments per 1,000 inhabitants
	2	Number of immovable cultural heritage objects per 1,000 inhabitants
	3	Number of immovable cultural heritage objects with valuable properties per 1,000 inhabitants
	4	Number of movable cultural objects per 1,000 inhabitants
	5	Funding for the maintenance of cultural heritage, Eur per capita
CHANGES GROUP	1	Percentage change in Lithuanian Council for Culture funding for organisations and artists, 2020–2021
	2	Percentage change in value-added of cultural enterprises' units performing traditional cultural activities, 2020–2021, Eur/capita
	3	Percentage change in value-added of cultural enterprises performing the new creative industries, 2020–2021, Eur/capita
	4	Percentage change in municipal budget expenditure on cultural services, 2020–2021
TOTAL:	40	

2 ■ METHODOLOGY

The European Commission's Joint Research Centre (JRC) and the Organisation for Economic Co-operation and Development (OECD) (Barbieri et al., 2017; Commission, 2008) have developed an internationally acknowledged 10-step methodology for constructing composite indices:

1. Developing a theoretical framework that defines and structures what is being measured, providing a basis for selecting and linking indicators into a meaningful index.
2. Selecting variables based on the analytical validity of the indicators, measurability, territorial coverage, and comparability between the territorial units under consideration.
3. Applying data interpolation: filling in missing data to obtain a complete dataset for all territorial units.
4. Conducting a multivariate analysis to investigate the overall structure of the dataset, assess its adequacy, and guide further methodological decisions.
5. Normalizing data, if necessary, to ensure comparability of variables.
6. Determining and summarizing the weights of the indicators, considering both theoretical assumptions and the results of the multivariate analysis.
7. Conducting uncertainty and sensitivity analysis to assess the robustness of the index, considering all possible sources of uncertainty associated with its construction.
8. Returning to the data to analyze which areas and indicators determine the results of the index.
9. Identifying possible linkages with other variables and existing known indicators.
10. Ensuring clear and accurate presentation and dissemination of the index results.

The index was compiled, taking into account the findings from the analysis of existing indices and following international methodological guidelines for index construction (Barbieri et al., 2017; Commission, 2008). The main methodological aspects are discussed in more detail below.

Theoretical background

The design of the Culture Index of Municipalities and the selection of indicators broadly follow the methodology described for the construction of the indices. The initial step involves an analysis of strategic documents on cultural policy, as they provide the key components for a meaningful index content. This process also considers the concept of cultural statistics previously developed (Mažeikaitė et al., 2022), which is relevant due to its establishment aimed at providing a comprehensive representation of the cultural field.

Data selection and interpolation

One of the initial steps in compiling the index was to assess the availability and accessibility of cultural data and its potential inclusion in the Culture Index of Municipalities. The selection criteria were relevance/representativeness, analytical reliability, the availability of time series, and accessibility.

If significant gaps are identified during the review of data, they are excluded from the index. Additionally, indicators that could disproportionately penalize municipalities lacking relevant infrastructure are excluded. For instance, an indicator related to the number of museums is included, but detailed museum statistics, such as permanent exhibitions and museum staff, are not included. This exclusion prevents municipalities without museums from receiving zero index values, which would heavily impact their ranking. The selection of indicators also involves choosing those that most accurately represent the cultural situation. For example, when faced with indicators on municipal budget expenditure encompassing sport, culture, and religion, the chosen indicator is municipal spending on cultural services due to its narrower and more precise focus on the cultural situation.

Where feasible, data gaps were filled through interpolation, using the previous year's values. All indicators are standardized and normalized in the index.

Indicators are grouped based on the principle of clustering closely related indicators together, determined by the Pearson correlation coefficient, scatter plots, and distributions. This grouping facilitates the assessment of indicators' impact on the sub-index. In some cases, correlated indicators are included to strengthen their impact, but each choice is conceptually justified. In other words, an indicator is retained in the index, irrespective of its correlation with other indicators, if it provides a relevant cross-section of information.

Standardisation

The indicators are standardized by reference to the population or another specified measure, depending on the interpretability of the resulting numerical values. Indicators are recalculated on a per capita or per 1,000 inhabitants basis to ensure equal comparability between municipalities. Other standardization measures, such as per employee (e.g., expenditure on salaries and wages of

employees by place of activity, in EUR/employee), or municipal budgets' expenditure on cultural services as a percentage of the total budget, are chosen on a case-by-case basis. In all cases, indicators within the same categories can be compared between municipalities.

While indicators can also be standardized by area, such as the number of cultural facilities per square meter, the choice was made, when creating the Municipal Culture Index, to primarily standardize indicators in relation to the population. This approach provides a more relevant picture of the cultural situation and the cultural supply available to society, indicating the number of institutions or artists per capita.

Normalisation

Standardized indicators are normalized on a 100-point scale. One option is to normalize so that the municipality with the highest value for the indicator receives a score of 100 points, while others receive a score proportional to their values. However, this method is not suitable for indicators with negative values, as it skews the scale negatively. Therefore, normalization is performed using the Min-Max function. This ensures a fair representation across indicators, accounting for both positive and negative values in individual municipalities (Commission, 2008). Normalisation is carried out using the following formula:

$$I_{i,s,t} = \frac{X_{i,s,t} - \min(X_{i,t})}{\max(X_{i,t}) - \min(X_{i,t})} \quad (1)$$

kur:

$X_{i,s,t}$ – indicator value, where i – name of the indicator ($i = 1, \dots, I$), s – municipality ($s = 1, \dots, S$), t – year (t – the current year).

$I_{i,s,t}$ – normalised value of the indicator, where i – name of the indicator ($i = 1, \dots, I$), s – municipality ($s = 1, \dots, S$), t – year (t – the current year).

Normalised indicators are assigned to values between 0 and 100. The maximum value of an index or sub-index is therefore 100.

Weights

The Culture Index of Municipalities is compiled by including indicators without weights. The primary motivation is to detach the culture index from political influences and to maintain its objectivity as much as possible. Additionally, the selection of indicators reflects the strategic documents of cultural policy, which do not specify higher or lower priorities. Following a general rule, all aspects of culture are considered important, without neglecting the significance of other cultural components. This approach aligns with UNESCO's concept of culture, based on the cycle of creation, dissemination, and perception, where all elements are seen as important and complementary. As in the case of the Canadian Well-being Index (Michalos et al., 2011), the principle of Laplace's indifference is applied, indicating that, in the absence of objective reasons to distinguish particular indicators as more important, all indicators are treated as equal.

Furthermore, statistical analyses were conducted for each domain, and correlation matrices were created. These analyses revealed varying degrees of correlation among the indicators, including positive, negative, or no correlation. Assigning equal weights may pose a risk, as differences in the dispersion of values or high correlation between individual indicators could lead some elements to have a disproportionate impact on the final index value (Barbieri et al., 2017). Therefore, by including variables with a positive correlation, we obtain a statistical weight for the relevant group of indicators. It's important to note that indicators are included based on their conceptual content, representing the information they convey.

Aggregation

Sub-indices are calculated using arithmetic averaging, wherein indicators are standardized and normalized before being included in a sub-index. The overall sub-index is then aggregated by calculating the arithmetic average. This method allows for compensations between indicators. For instance, if a municipality has a low value for the number of professional artists but a high value for the number of amateur arts groups, averaging these indicators results in a balanced representation, as the low value of one indicator is compensated by the high value of the other. This practice aligns with other indices, such as the Gender Equality Index, which also utilizes the arithmetic mean for aggregating indicators into sub-indices, and the geometric mean for aggregating sub-indices into domains and the domains into the index, motivated by similar considerations (Barbieri et al., 2017).

$$SUB_SKI_s = (\sum_{i=1}^I I_{i,s,t}) / I, \tag{2}$$

kur:

SUB_SKI_s – sub-index of Culture Index of Municipalities,

$I_{i,s,t}$ – normalised value of the indicator, where i – name of the indicator ($i = 1, \dots, I$), s – municipality ($s = 1, \dots, S$), t – year (t – the current year).

However, the sub-indices are aggregated using the geometric mean to calculate the final index. This method reduces the compensation effect, ensuring that a deficiency in one aspect, such as cultural heritage sites or funds for their management, will not be fully offset by, for example, the number of artists. The Municipal Cultural Index is calculated as the geometric mean of the sub-indices, following the formula:

$$SKI_s = \sqrt[n]{SKI_SUB_{1,s} \cdot SKI_SUB_{2,s} \cdot \dots \cdot SKI_SUB_{n,s}}, \tag{3}$$

kur:

SKI_s – Culture Index of Municipalities,

$SUB_SKI_{1,s}$ – sub-index,

n – number of sub-indices,

s – municipality.

It's noteworthy that in Visaginas municipality, the cultural heritage sub-index was zero. When dealing with zero values, it is not possible to calculate the geometric mean. As a solution, Visaginas municipality has been assigned a value of one for this sub-index, representing the lowest value compared to other municipalities and the minimum value.

Figure 2 The scale of Culture Index of Municipalities 2022 (compiled by the author)

Sub-indices

For the Municipal Culture Index, 40 indicators were selected (41 in 2021) and grouped into 7 sub-indices. As mentioned earlier, the goal was to include indicators in each sub-index with the most similar focus. Each sub-index comprises between 2 and 9 different indicators, with an average of 5 to 6 indicators. This selection is considered optimal, as a larger number of indicators would complicate the meaning and interpretation of each sub-index. The following sub-indices are created:

1. Cultural Organisations (7 indicators);
2. Artists (2 indicators);
3. Macroeconomics of Culture (8 indicators);
4. Funding for Culture (5 indicators);
5. Cultural Participation and Social Capital (9 indicators);
6. Cultural Heritage (5 indicators);
7. Changes Group (4 indicators).

The groups of sub-indices in the Municipal Culture Index must be statistically independent of each other, and their relationships must be theoretically and empirically described (Commission, 2008). In this case, a statistically significant and strong positive correlation is found only between two sub-indices: the 'Funding for Culture' sub-index and the 'Cultural Organisations' sub-index. This correlation arises from the inclusion of information related to the number of organisations in both sub-indices. Typically, a higher number of organisations leads to a higher level of funding, especially from entities like the Lithuanian Council for Culture. Consequently, trends in these sub-indices are mutually reinforcing and carry more weight in the overall index. The statistically significant relationships between the other sub-indices are weak or not significant at all. Each sub-index, therefore, provides additional information to the index without duplicating the content of the other included sub-indices.

3 ■ SUB-INDICES

The initial ranking in the study involves a comparison of the population by municipalities. It's crucial to note that nearly all indicators in the Culture Index of Municipalities are converted to size per 1,000 inhabitants, ensuring an objective comparison of municipalities. Despite higher absolute values, the size per capita is essential for a fair assessment. For instance, Neringa, the smallest municipality with just over 4,000 inhabitants, counts 29 professional artists, resulting in 7 artists per 1,000 inhabitants. In contrast, Alytus city municipality, with over 52,000 inhabitants, estimates 39 professional artists, resulting in slightly less than 1 artist per 1,000 inhabitants (0.74 professional artists per 1,000 inhabitants). This per capita perspective is what ultimately determines the differences between municipalities recorded in the index.

Figure 3 Population, thousands, 2021-2022 (compiled by the author on the basis of State Data Agency data)

3.1 ■ CULTURAL ORGANISATIONS

CULTURAL ORGANISATIONS 2022 IN LITHUANIA

7 936 cultural organisations

> 6 cultural organisations per 1,000 habitants in
Vilnius city

588 culture centres

110 museums

1 190 libraries

1 097 NGO

Considering seven different indicators: number of cultural enterprises, number of branches of cultural enterprises performing traditional cultural activities, number of branches of cultural enterprises performing new creative industries activities, number of organisations in the non-budgetary sector, number of libraries, museums, and cultural centres per 1,000 inhabitants—and taking the arithmetic mean of the normalized values of these indicators, we obtain the sub-index of cultural organisations.

Table 2 Cultural organisations sub-index, 2021-2022 (compiled by the author)

29	30	Kaišiadorys district	23,05	23,02	- 0,03	60	60	Visaginas	7,43	7,36	- 0,07

Note: R 2021 and R 2022 refer to the sub-index ranking for 2021 and 2022 respectively.

Figure 4 Ranking of municipalities by sub-index of cultural organisations, 2021-2022 (compiled by the author)

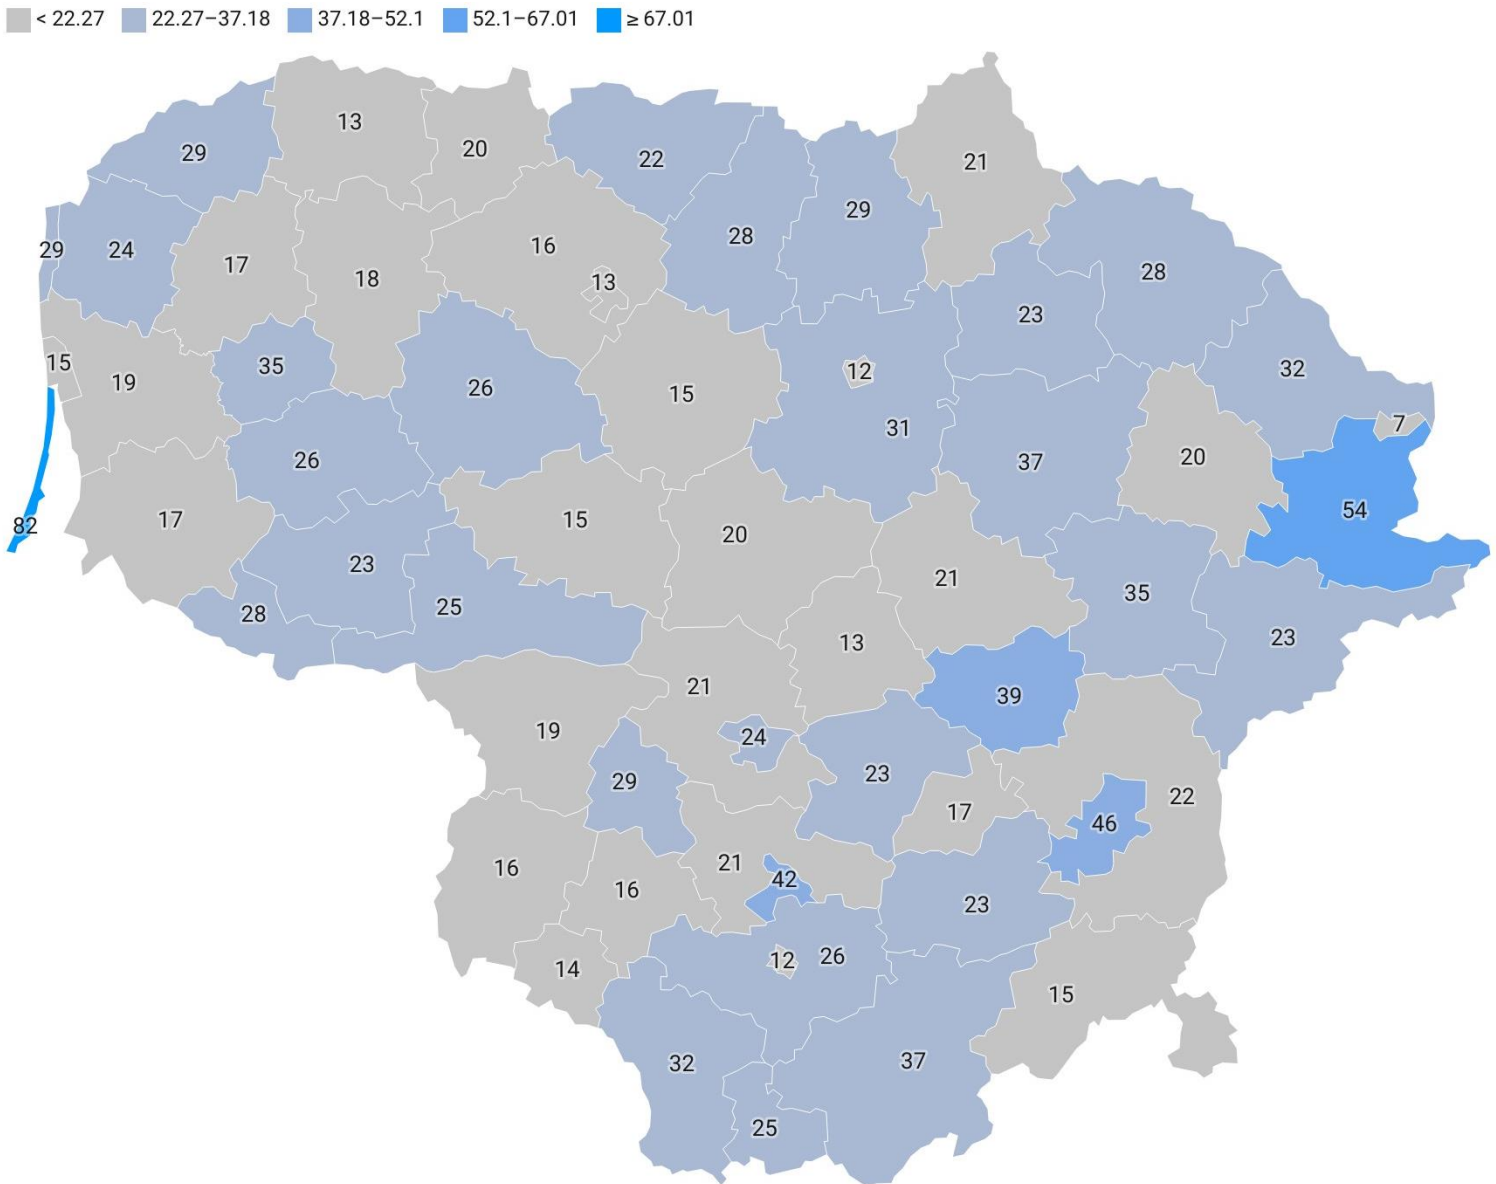

Figure 5 Ranking of municipalities by sub-index of cultural organisations, 2022 grouped results (compiled by the author)

The map visually illustrates the distribution of values for the 'Cultural Organisations' sub-index across Lithuanian municipalities. Darker shades of blue indicate higher sub-index values, while grey represents the lowest scores for the cultural organisations sub-index. The map clearly highlights a significant gap between Neringa municipality and the rest of Lithuania.

3.2 ■ ARTISTS

ARTISTS 2022 IN LITHUANIA

11 089 professional artists

3 318 amateur art collectives

By calculating the arithmetic average of the normalized rates of the number of professional artists and amateur art collectives per 1,000 inhabitants, we obtain a sub-index representing artists in municipalities. Additionally, a comparison with the sub-index of the previous year is provided.

Table 3 Artists sub-index, 2021-2022 (compiled by the author)

R 2021	R 2022	Municipality	2021	2022	Difference: 2022-2021	R 2021	R 2022	Municipality	2021	2022	Difference: 2022-2021

Note: R 2021 and R 2022 refer to the sub-index ranking for 2021 and 2022 respectively.

Figure 6 Ranking of municipalities by Artists sub-index, 2021-2022 (compiled by the author)

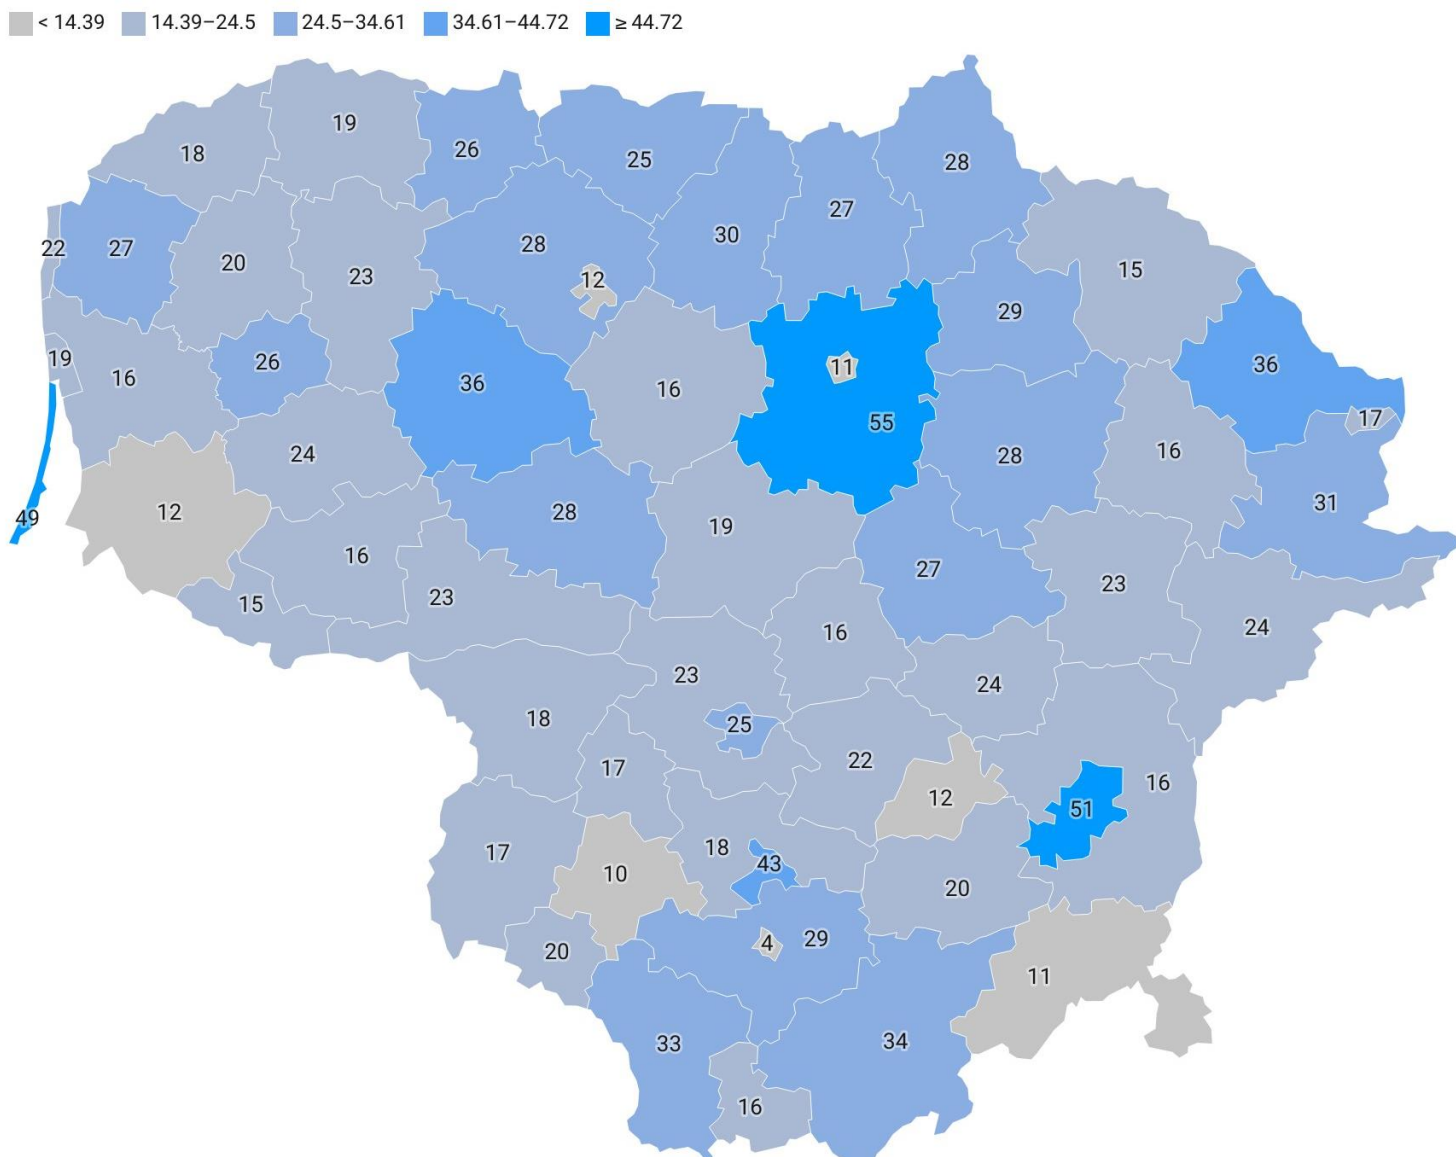

Figure 7 Ranking of municipalities by Artists sub-index, 2022. Grouped results (compiled by the author)

The 'Artists' sub-index ranges from 4.28 (grey municipalities) to 54.83 (brighter blue). The map illustrates that the total number of artists (both professional and amateur) per 1,000 inhabitants in Lithuanian municipalities is generally low. Only the municipalities of Birštonas, Neringa, Vilnius, and Panevėžys show more positive values.

3.3

MACROECONOMICS OF CULTURE

MACROECONOMICS OF CULTURE 2022 IN LITHUANIA

~ 6,1 billions Eur turnover of cultural enterprises

99 734 number of employees

1,6 billions Eur expenditure on salaries

2,5 billions Eur value added

By taking the 8 indicators related to turnover, employee expenditure, number of employees, and value added of cultural enterprises engaged in both traditional cultural activities and new creative industries activities, and calculating the arithmetic mean of these normalized averages, we derive the sub-index of the cultural macroeconomy.

Note: R 2021 and R 2022 refer to the sub-index ranking for 2021 and 2022 respectively.

Figure 8 Ranking of municipalities according to the cultural macroeconomy sub-index, 2021-2022 (compiled by the author)

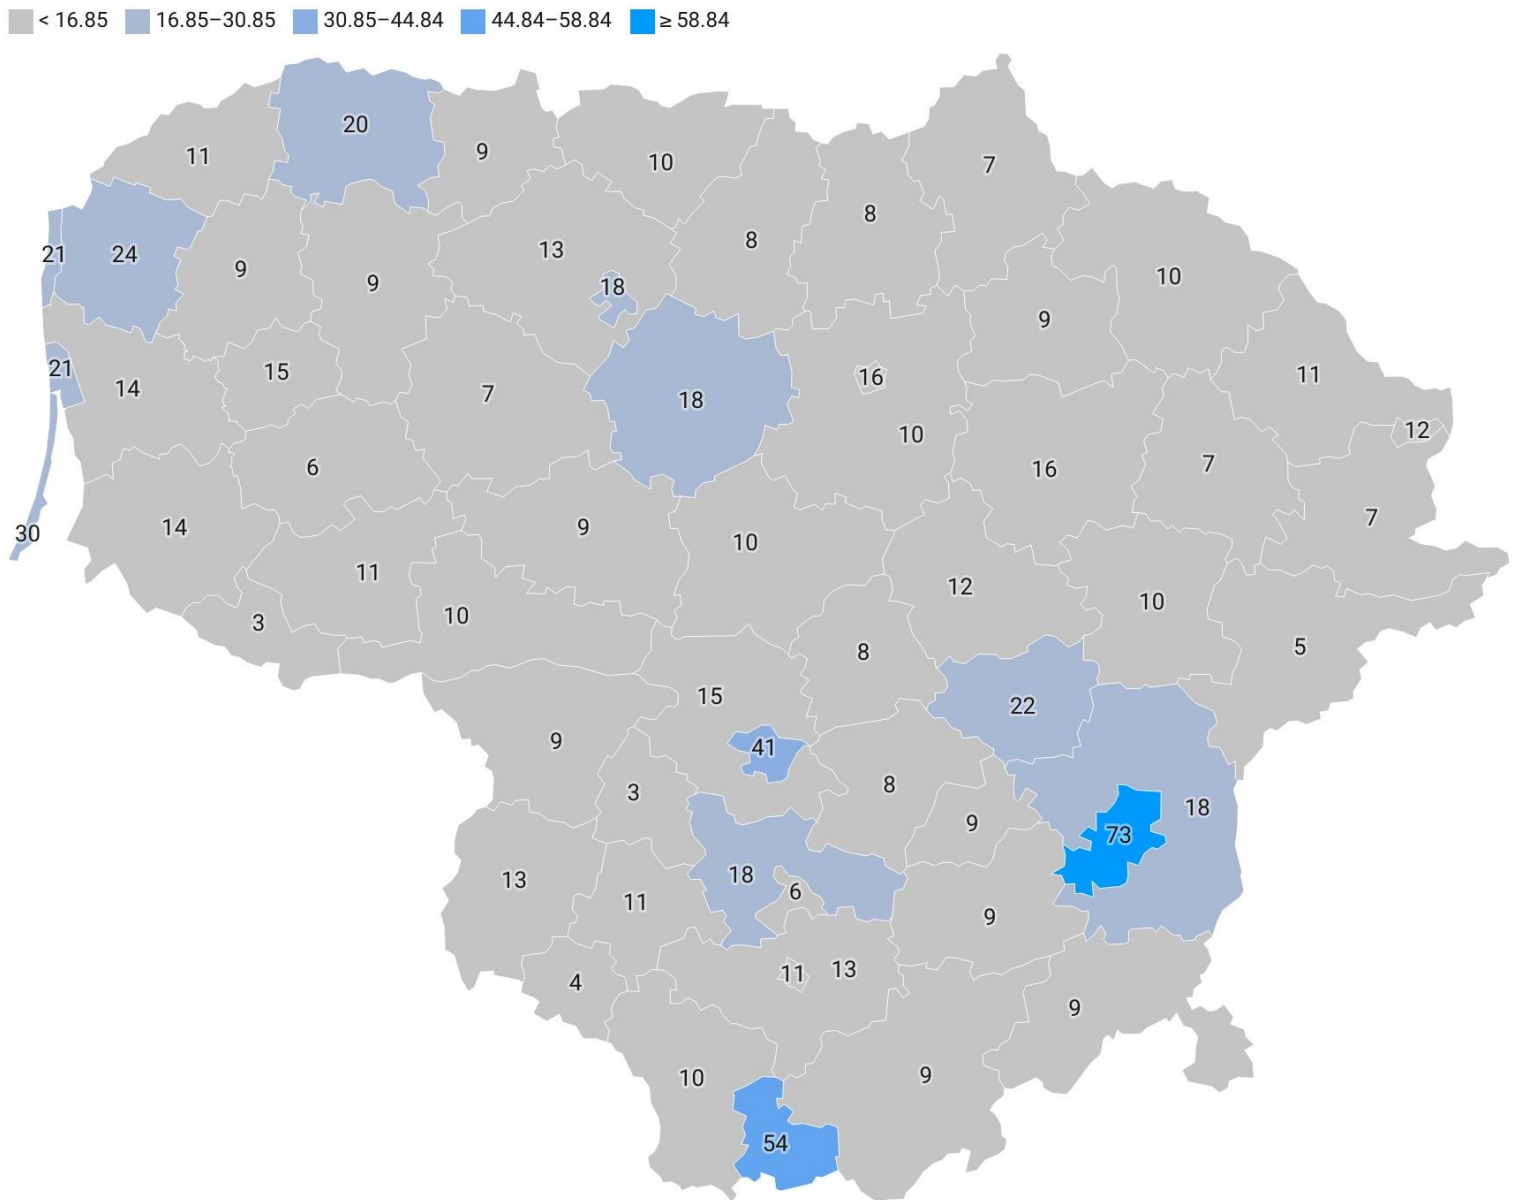

Figure 9 Ranking of municipalities by cultural macroeconomy sub-index, 2022, grouped results (compiled by the author)

The values of the sub-index of municipal culture macroeconomics range from 2.85 in Kazlų Rūda municipality to 72.84 in Vilnius municipality. However, the grey color dominates in most of Lithuania, indicating a significant gap between Vilnius municipality, which has the highest score, and the rest of Lithuania, most of which fall in the lowest score group (up to 16.85). The macroeconomics of culture sub-index assesses the cultural sector's economic performance, particularly within cultural and creative industries. The map reveals that the cultural and creative industries sector is primarily concentrated in Vilnius city municipality.

3.4

FUNDING FOR CULTURE

**FUNDING FOR CULTURE
2022 IN LITHUANIA**

~ 235 millions Eur

**municipal budget expenditure
on cultural services**

20 496 705 Eur

**organisations received
Lithuanian Council for Culture
funding**

The sub-index on funding for culture is constructed by assessing the share of Lithuanian Council for Culture funding for artists and organisations, the share of municipal budgets' expenditure on cultural services per inhabitant, funding for artists, and finally, the share as a percentage of the total budget of the municipality. After calculating the arithmetic average of these normalized indices, the final value of the sub-index is obtained.

Note: R 2021 and R 2022 refer to the sub-index ranking for 2021 and 2022 respectively.

Figure 10 Ranking of municipalities by sub-index of funding for culture, 2021-2022 (compiled by the author)

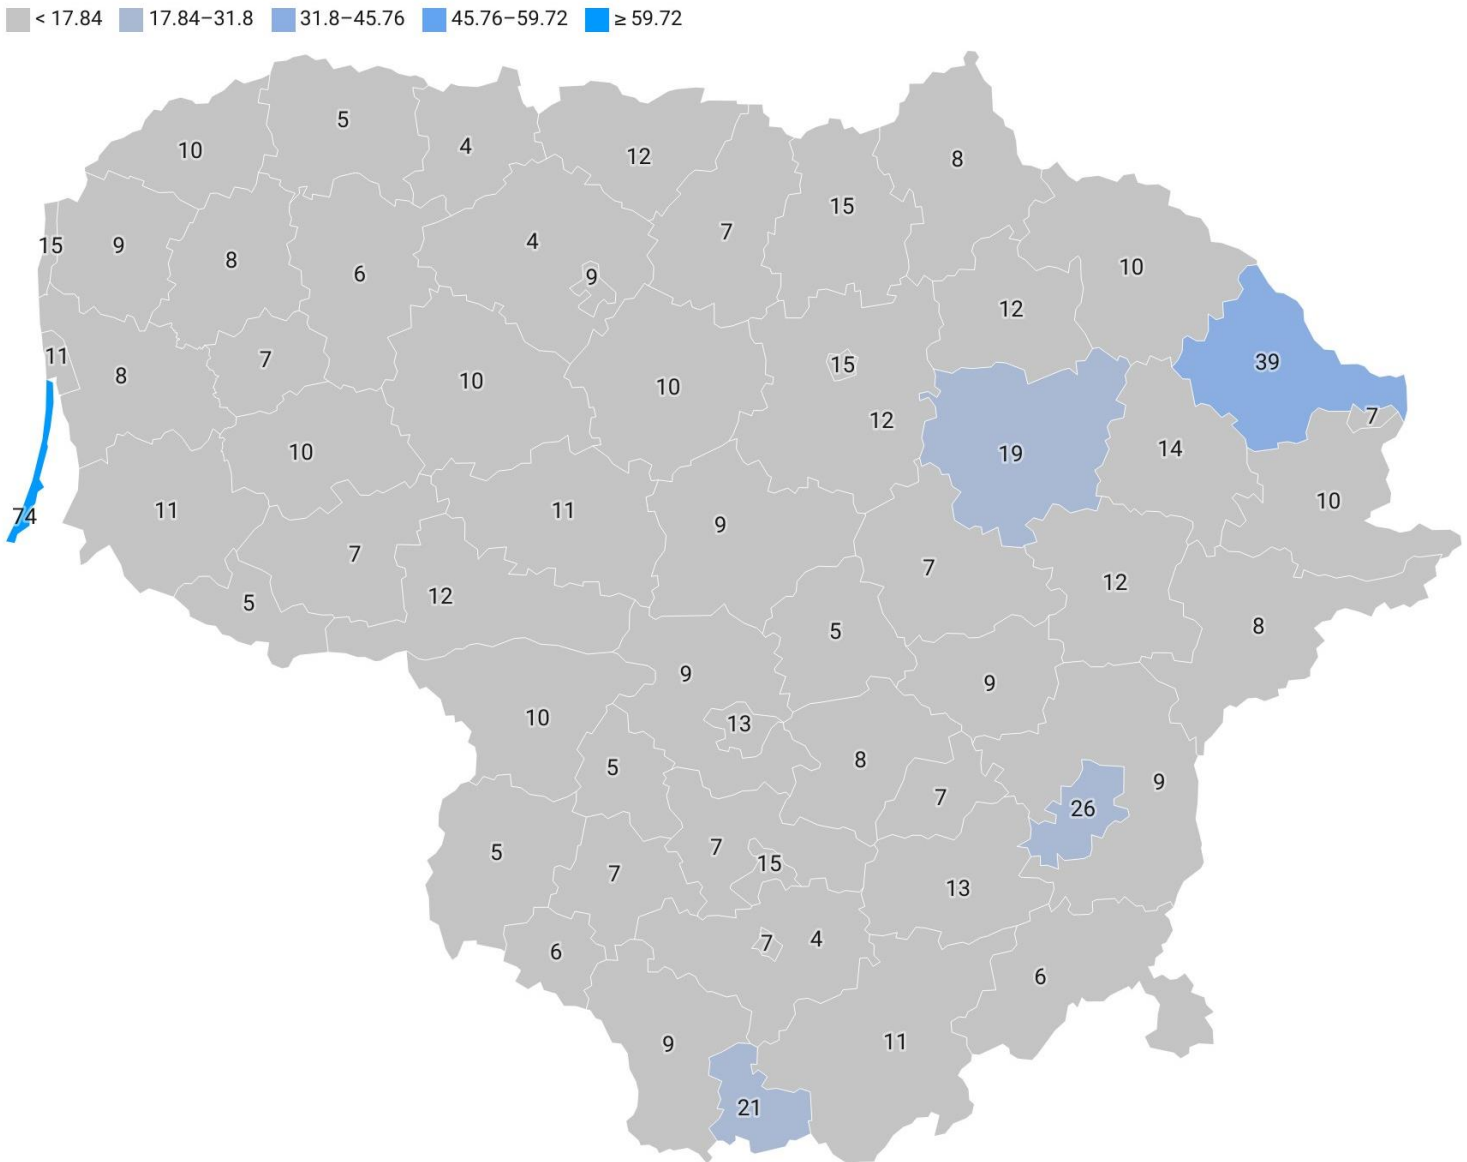

Figure 11 Ranking of municipalities by sub-index of funding for culture, 2022. Grouped results (compiled by the author)

The values of the culture funding sub-index are distributed across a wide range, from 3.88 (Alytus) to 73.68 (Neringa). However, the majority of values are extremely low, not even reaching 20 points. The sub-index on funding for culture reveals the most sensitive situation compared to other sub-indices. This is particularly evident in the map of grouped data, where almost the entire area of Lithuania is covered by the same grey color. Almost all municipalities in Lithuania fall within the first sub-index, scoring below 18 points.

3.5 ■ CULTURAL PARTICIPATION AND SOCIAL CAPITAL

**CULTURAL PARTICIPATION
AND SOCIAL CAPITAL 2022
IN LITHUANIA**

~ 4,9 million museum visitors

48 859 participants in cultural centres

450 869 library users

~ 7,5 million library visitors

10-27 % people who would certainly describe themselves as a creative person

The sub-index 'Cultural Participation and Social Capital' comprises 9 indicators: the number of participants in cultural centers, the number of museum visitors, the number of library users, the number of library visits, the percentage of the population (aged ≥ 15 years) that consumed cultural products/used cultural services in the last 12 months, the proportion of the population that participates in historical remembrance events and values civic and national identity, the proportion of the population that could certainly describe themselves as creative people, the proportion of the population that strongly agrees that it is beneficial for a society to be culturally diverse, and the population's satisfaction with the accessibility of cultural services. After normalizing these indicators, the arithmetic mean is calculated, and the final value of the sub-index is obtained.

Note: R 2021 and R 2022 refer to the sub-index ranking for 2021 and 2022 respectively.

Figure 12 Ranking of municipalities according to the sub-index on cultural participation and social capital, 2021-2022 (compiled by the author)

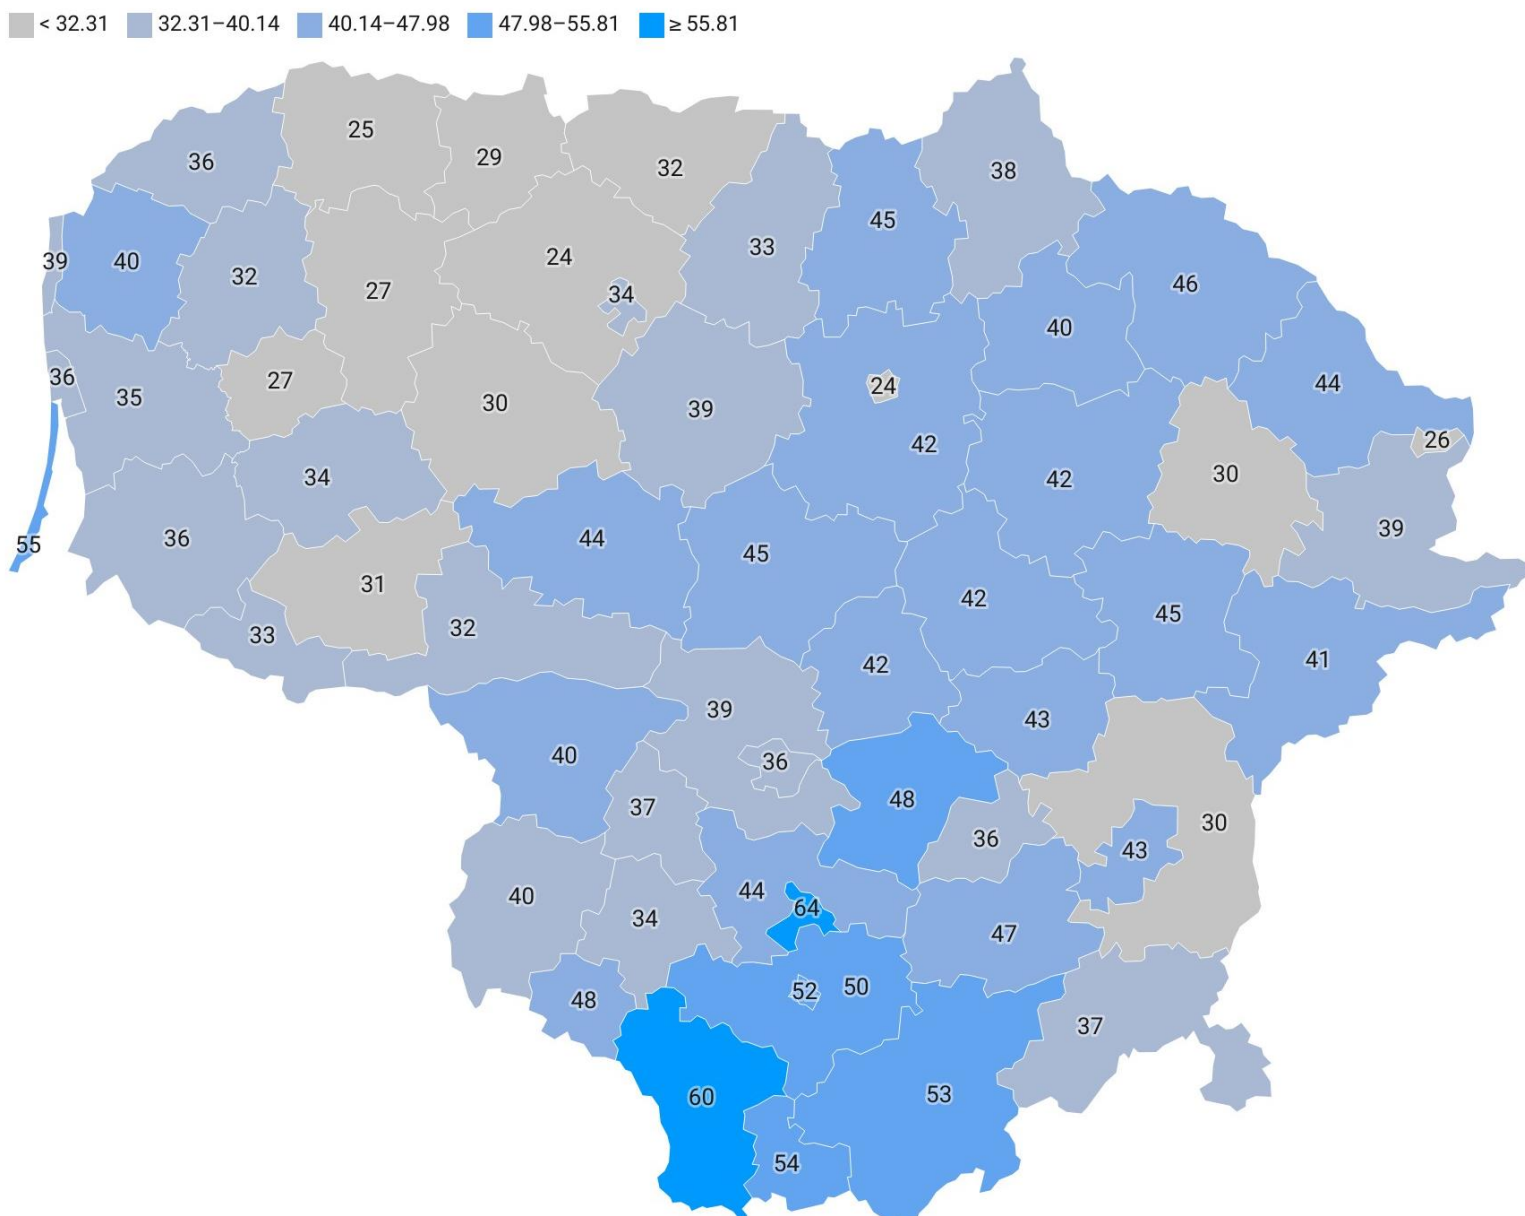

Figure 13 Ranking of municipalities according to the sub-index of participation in culture and social capital, 2022. Grouped results (compiled by the author)

The average score for the sub-index on cultural participation and social capital is 39.18. The values range from 63.64 in Birštonas municipality to 24.48 in Panevėžys municipality. Notably, the indicators for this sub-index are lower in Telšiai and Šiauliai districts. However, the gaps between the leading municipality and the others are not as large as, for example, in the sub-index on funding for culture. Additionally, all municipalities in major cities, except Panevėžys, scored at least slightly higher than their district municipalities. Panevėžys municipality lags almost twice as far behind its district municipality.

3.6 ■ CULTURAL HERITAGE

**CULTURAL HERITAGE
2022 IN LITHUANIA**

2 333 cultural heritage monuments

26 008 immovable cultural heritage objects

9 131 movable cultural heritage

> 33 million Eur municipal funding for the
maintenance of cultural heritage

The Cultural Heritage sub-index consists of indicators on the number of cultural heritage monuments, the number of immovable cultural objects, the number of immovable cultural objects with valuable characteristics, the number of movable cultural objects, and the average 3-year funding for the maintenance of cultural heritage. All five indicators are normalized, and their arithmetic mean is calculated to derive the value of the Cultural Heritage sub-index.

24	30	Skudadas district	23,51	21,63	- 1,88	60	60	Visaginas	0,00	0,00	0,00

Note: R 2021 and R 2022 refer to the sub-index ranking for 2021 and 2022 respectively.

Figure 14 Ranking of municipalities by cultural heritage sub-index, 2021-2022 (compiled by the author)

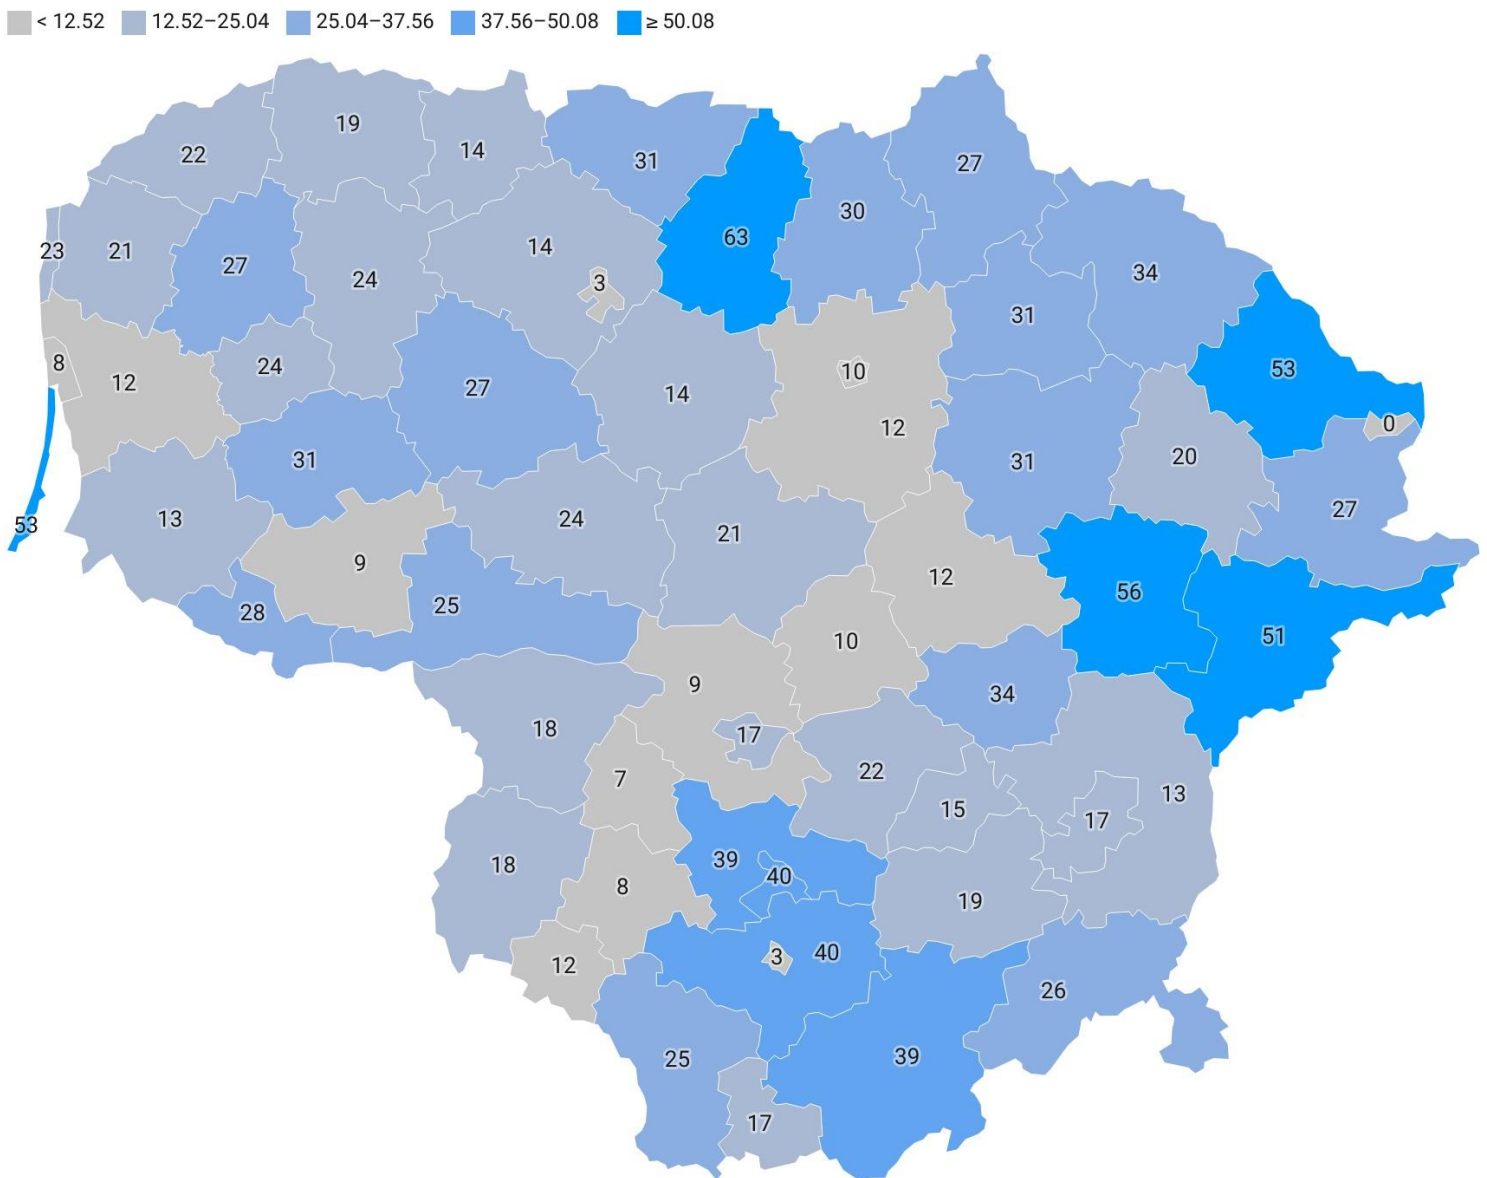

Figure 15 Ranking of municipalities by cultural heritage sub-index, 2022. Grouped results (compiled by the author)

The Cultural Heritage sub-index scores range from 0 (Visaginas municipality) to 62.6 in Pakruojis municipality. The average score for the Cultural Heritage sub-index is 23.15 (compared to 22.09 in 2021). Higher values of the sub-index score are notable in individual municipalities of Tauragė, Utena, Alytus, and Šiauliai regions. This suggests that the variables of the cultural heritage group are not concentrated in only a few municipalities or in one part of Lithuania, as was the case for other sub-indices.

3.7 ■ CHANGES GROUP

The selected indicators of the Changes group indicate that both cultural organisations and artists should contribute to the cultural environment of the municipality, generating relevant and professional ideas for cultural projects and attracting funding from the Lithuanian Council for Culture. Additionally, they should add value through the activities of enterprises, and municipalities should financially stimulate the cultural sphere. The Change group ignores the former absolute values, allowing municipalities with very low initial values but positive changes to rank at the top. The indicators in the Changes group highlight positive trends that, if maintained, could lead to an increase in the overall cultural environment in the municipality in the long term.

The Changes group consists of four indicators that measure the percentage change between 2021 and 2022. It assesses the change in the amount of LCT funding attracted by municipalities, the change in value added (two types of enterprises and their units: those performing new CI activities and those performing traditional cultural activities), and the change in municipal budget spending on cultural services. Once the changes have been calculated, the indicators are normalized, and the arithmetic mean of the normalized indicators forms the sub-index values.

Figure 16 Ranking of municipalities according to the Changes Group sub-index (compiled by the author)

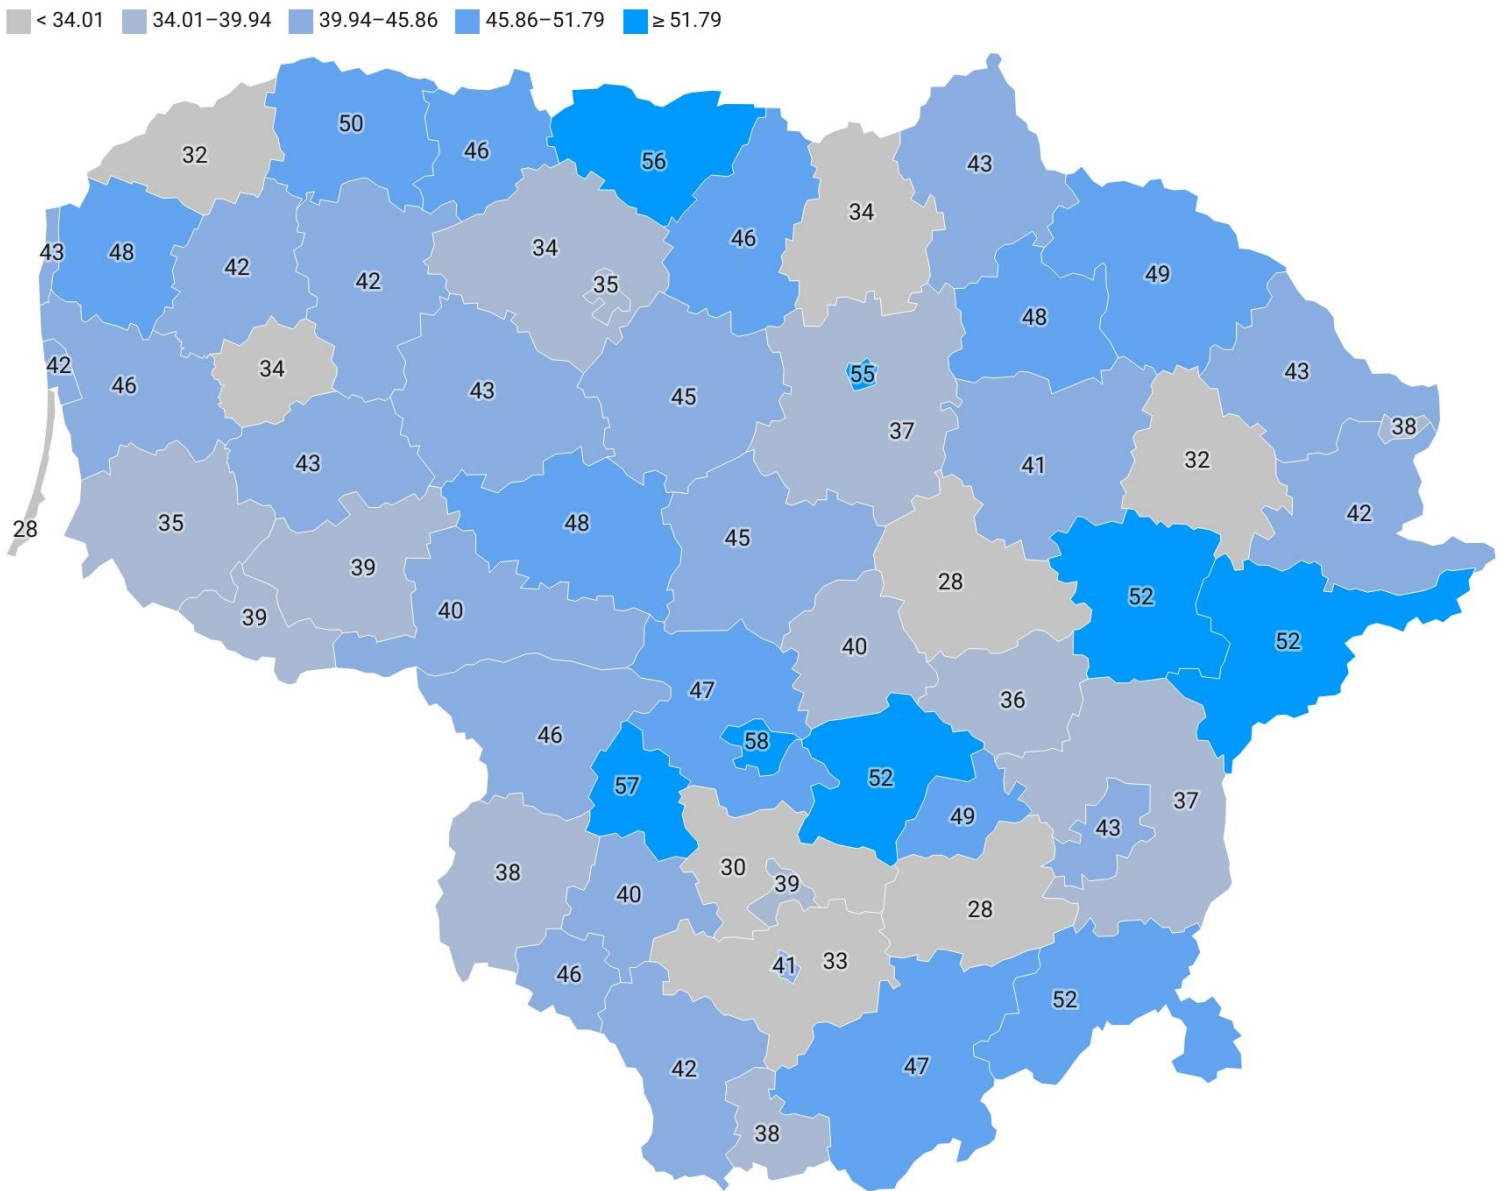

Figure 17 Ranking of municipalities by the Changes Group sub-index, 2022. Grouped results (compiled by the author)

In 2021, Western Lithuania showed a more positive trend in this sub-index, while in 2022, the opposite was observed. This essentially indicates that there is no consistent growth of the indicators in the municipalities. If municipalities have strongly increased funding for cultural services in one year, it is more likely that funding will not increase again or may even decrease in the following year. This is why this sub-index shows the most significant differences in municipal rankings when comparing 2021 and 2022.

3.8

**SUMMARY OF
SUB-INDICES**

The sub-index on funding for culture revealed significant gaps between municipalities. Neringa municipality scored more than 73 out of a possible 100 points, while half of the municipalities were below the 9-point threshold. This also resulted in the lowest average score for the sub-index (11.25) compared to other sub-indices.

The average for **the sub-index on cultural macroeconomic** indicators was not much higher than for the sub-index on financing for culture. The average score for the cultural macroeconomics sub-index is 13.91. The maximum value of this sub-index in 2022 was reached by Vilnius municipality (72.48), while the remaining municipalities lagged far behind the capital. Half of Lithuania's municipalities were within 10.5 points in this sub-index. This basically shows that only Vilnius city is active in the cultural and creative industries sector.

Cultural supply is represented by **sub-indices of cultural organisations and artists**, and their averages are similar. The average for the cultural organisations sub-index is 24.7, with Neringa municipality dominating this sub-index with a score of almost 82, the highest among all sub-indices. Half of the Lithuanian municipalities scored less than 23 points in this sub-index. The average score for the artists sub-index is 23.33, and as in the case of the cultural organisations sub-index, half of the municipalities were below the 23-point threshold.

The average score for **the cultural participation and social capital sub-index** is slightly higher compared to the other sub-indices, reaching 39.18 in 2022. Among the municipalities, Birštonas had the highest score at 63.64, while Panevėžys municipality had the lowest score, almost three times behind Birštonas, with 24.48 points.

The average score for **the cultural heritage sub-index** in 2022 is 23.17. Pakruojis municipality achieved the highest score (62.6), while Visaginas municipality obtained the lowest value for the sub-index. Half of the Lithuanian municipalities did not score more than 21.4. Although there are gaps between municipalities, they are not as pronounced as in the sub-indices on funding for culture or cultural macroeconomics.

The changes group sub-index had the highest average score at 42.23. The gaps between municipalities are not as large, as indicated by the smaller variation in sub-index values, which range from 28 to 58 points. More than half of the municipalities scored above 42 points.

Culture Index of Municipalities
 Max: 49,39 (Neringa)
 Average: **21,4**
 Min: 10,14 (Visaginas)

A better understanding of the factors influencing a municipality's position in the Culture Index ranking can be gained by examining its rankings in each sub-index. For two consecutive years, Neringa, holding the top position in the Culture Index of Municipalities, consistently leads in most sub-indices, ranking 1-4 in all of them, except for the Changes group.

60	60	Visaginas	10,48	10,14	-0,34	0

Neringa municipality tops the 2022 Municipal Culture Index with a score of 49.39 out of a possible 100 points. This marks the second consecutive year of Neringa securing the first position. However, in 2021, the Municipal Culture Index achieved a higher score of 56.91 points. While maintaining the top position, the gap from the maximum score indicates the potential for municipalities to enhance their cultural situation.

The second position is held by Vilnius city municipality, scoring slightly over a third of the possible points, i.e., 39.13 (compared to 37.91 in 2021). Vilnius municipality also secured the second position in the previous year's Municipal Culture Index. However, the overall situation and the Municipal Culture Index score have remained relatively stable. It's noteworthy that the capital of Lithuania scores less than half of the possible Municipal Culture Index points.

The third position is once again secured by the same municipality as in 2021 – Zarasai municipality, achieving a score of 33.56 points (compared to 31.54 in 2021). In the previous year, Druskininkai municipality closely trailed Zarasai (31.22 in 2021). In 2022, Druskininkai municipality maintains the fourth position, but the gap has widened, scoring 29.01 points. Occupying positions 5–7 are three municipalities with closely aligned scores: Birštonas municipality (5th position, 28.93 points), Anykščiai municipality (6th position, 28.6 points), and Molėtai municipality (7th position, 28.11 points).

In 2021, the three largest municipalities found themselves at the bottom of the ranking. Panevėžys municipality occupied the 53rd position with only 14.48 points, Šiauliai municipality was in the 57th position with 13.67 points, and Alytus municipality ranked 59th with 10.91 points. In 2022, Panevėžys municipality improved its standing, moving up to the 48th position with 16.99 points. This positive trend suggests potential future advancements for Panevėžys municipality in the index ranking. However, a significant challenge remains, as public engagement in culture is currently passive compared to other municipalities.

On the other hand, Šiauliai and Alytus municipalities continued to struggle in 2022. Alytus municipality scored 11.21 points, retaining the 59th position, while Šiauliai municipality scored 13.74 points, staying at the 58th position. Given their population size, these cities lack a robust cultural offering, including cultural enterprises and artists. Municipal involvement in cultural funding is also a concern in these areas, impacting the diversity of cultural choices available to the population.

For the second consecutive year, Visaginas finds itself at the bottom of the ranking, scoring around 10 points (10.48 in 2021).

The average Municipal Culture Index score is 21.4. The Culture Index ranking of nine municipalities has remained unchanged, while 26 municipalities have improved their position in the Municipal Culture Index. Conversely, 25 municipalities have seen a decline in their ranking in the Municipal Culture Index.

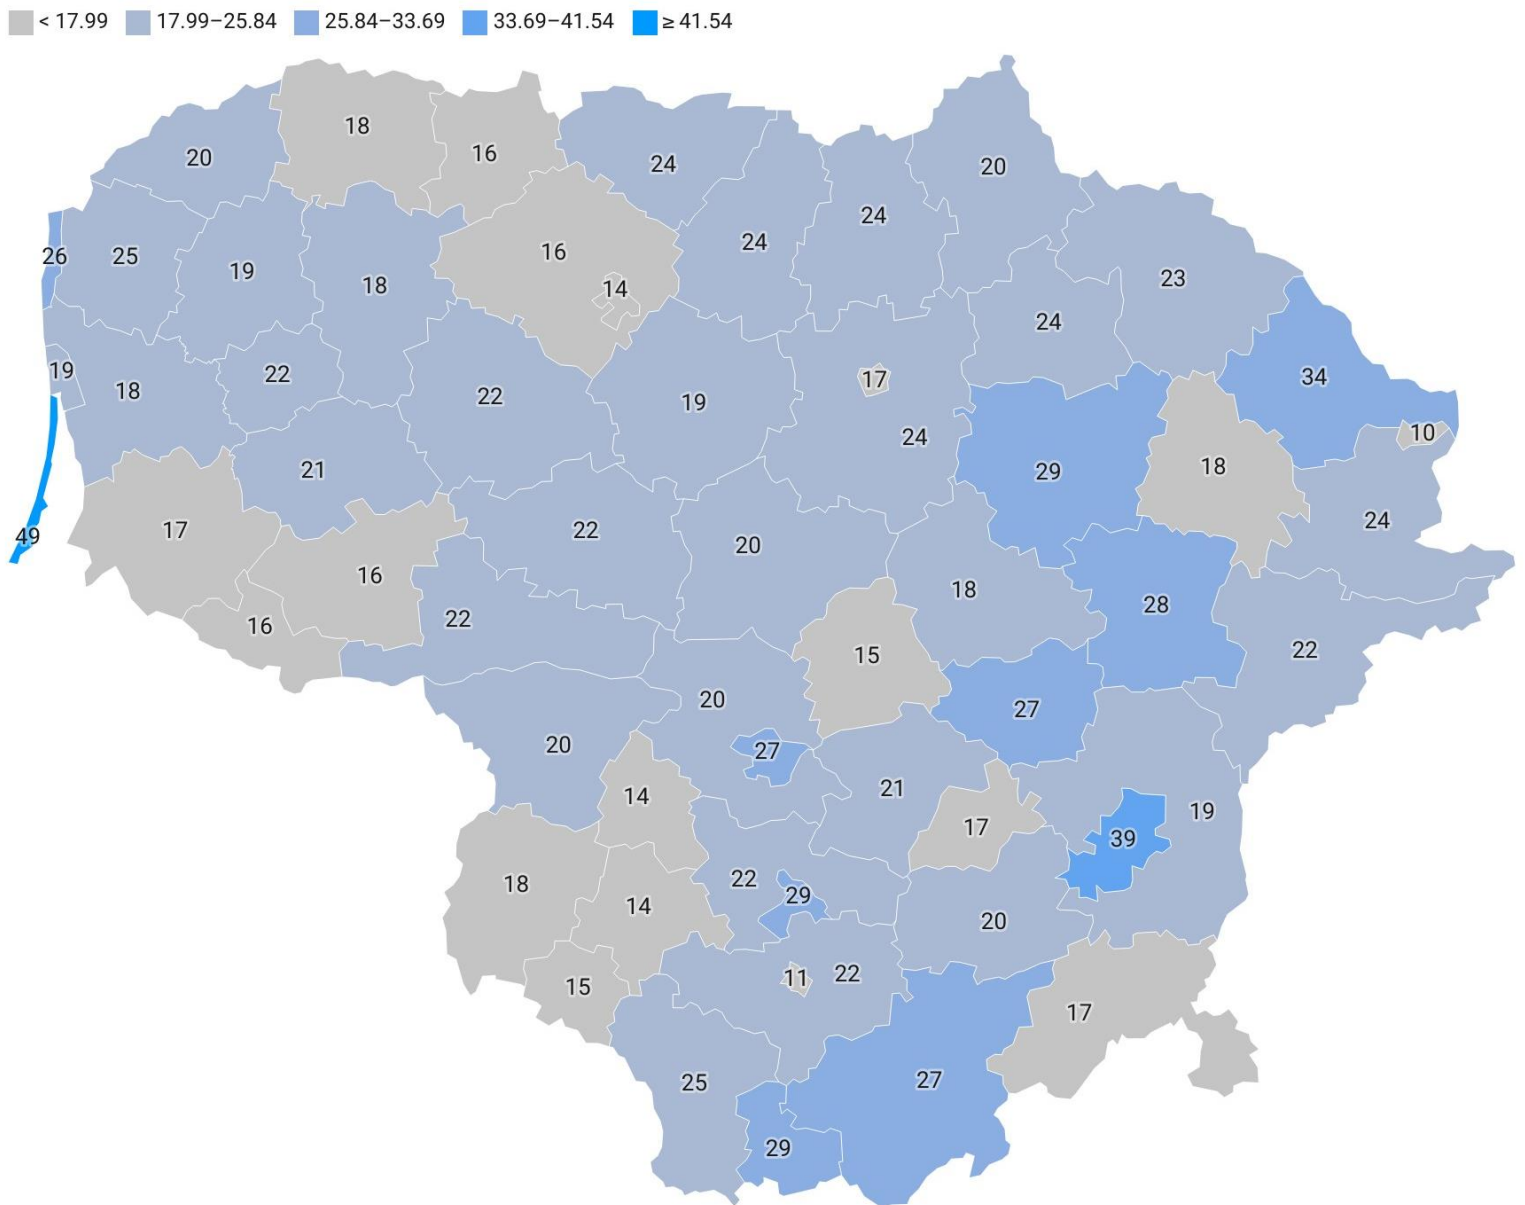

Figure 19 Municipal Culture Index Ranking, 2022 (compiled by the author)

Looking at the grouped results of the Municipal Culture Index, the map illustrates that the majority of Lithuania falls within the lower range of the Municipal Culture Index, dominated by municipalities scoring up to 26 out of a possible 100 points (depicted in grey and light blue). Notably, Lithuanian resorts stand out positively in terms of Municipal Culture Index values, including the municipalities of Neringa, Birštonas, Druskininkai, Palanga (all scoring over 25 points), and several resort areas like Zarasai and Anykščiai (scoring over 28 points). Širvintos municipality can also be highlighted, leading among all other municipalities in Vilnius county and trailing the capital by only about 12 points.

5

■ CULTURE INDEX IN THE CLUSTERS OF MUNICIPALITIES

Figure 20 Culture Index of Municipalities ranking by municipal clusters, 2022 (compiled by the author)

Municipalities are further classified in the Municipal Culture Index into the following clusters: large city municipalities (6 municipalities), rural municipalities (38 municipalities), resort municipalities (4 municipalities), and other municipalities (12 municipalities). The clustering is based on the principle of minimizing differences within a cluster and maximizing differences between different clusters.

In both 2021 and 2022, the cultural situation in the clusters is dominated by resorts. Resort municipalities have, on average, the highest Municipal Culture Index value of 33.3 (35.11 in 2021), and Neringa municipality, a resort, has consistently achieved the highest Municipal Culture Index value for several years in a row (49.39 in 2022) when compared to all municipalities.

It is noteworthy that, when examining the average values of the Municipal Culture Index in the clusters, there are no significant differences between large cities and rural municipalities – the average value of the index in both clusters is 21.19 points. There are also no significant differences in the maximum and minimum values of the indexes scored in these clusters. The cluster of other municipalities has the lowest average index score (18.23) and the lowest maximum index score (26.83). However, the minimum index value is similar to those of large cities and rural municipalities. The cluster of resort municipalities stands out in terms of minimum index values, with the minimum index value for this cluster remaining above 25 points for two consecutive years.

Table 12 Culture Index values by municipal clusters, 2021–2022 (compiled by the author)

	Average		Maximum score		Minimum score	
	2022	2021	2022	2021	2022	2021
Large cities	21,19	19,99	39,13	37,91	11,21	10,91
Rural municipalities	21,19	20,62	33,56	31,54	14,12	11,9
Other municipalities	18,23	17,89	26,83	28,19	10,14	10,48
Resorts	33,30	35,11	49,39	56,91	25,88	25,17

CONCLUSION

1. The Municipal Culture Index emphasizes the use of quantitative indicators, and there are several reasons for this choice. The decision to exclude qualitative assessments or expert opinions from the index is rooted in the desire for objectivity, reliability, and representativeness. The inclusion of qualitative assessments could introduce subjectivity and potential bias, as opinions may vary among different groups of experts, and opinions may change over time.

The quality of culture is indirectly reflected in the selected quantitative indicators. For example, the number of professional artists, funding decisions by the Lithuanian Council for Culture, and the activity of the NGO sector can all provide insights into the richness and diversity of the cultural scene. Additionally, indicators related to population participation in cultural activities, such as museum visits and cultural consumption, as well as satisfaction with the availability of cultural services, offer a perspective on the qualitative aspects of cultural life.

While the Municipal Culture Index is primarily composed of quantitative data, the overall index score does capture aspects of the qualitative parameters of the cultural situation. The emphasis on measurable and objective data helps ensure transparency and comparability across municipalities, contributing to the robustness of the index.

2. The average Municipal Culture Index score is 21.4 out of 100. The range of values across municipalities is quite diverse, spanning from 10.14 (Visaginas municipality) to 49.39 (Neringa municipality). This broad spectrum suggests significant variations in the cultural situations and performances of different municipalities.

Furthermore, the observation that no municipality demonstrates a strong score across all seven groups of the Municipal Culture Index emphasizes the multidimensional nature of cultural vitality. Each municipality has its strengths and weaknesses across various aspects of cultural life, such as the presence of cultural organisations, the engagement of artists, economic aspects related to culture, funding patterns, participation rates, social capital, cultural heritage, and changes over time.

3. For several consecutive years, resort municipalities have consistently performed well in the Municipal Culture Index rankings. On average, resort municipalities have the highest Municipal Culture Index value, reaching 33.3. Notably, Neringa municipality, classified as a resort municipality, has consistently secured the highest index value

overall, achieving 49.39 in 2022. This trend underscores the cultural vibrancy and performance of resort areas in comparison to other types of municipalities.

It is also noteworthy that the cluster of large cities does not surpass the results achieved by resort municipalities in the Municipal Culture Index rankings. This highlights the distinctive cultural strengths of resort areas in the overall municipal cultural landscape.

4. It's important to highlight the disparities among major cities. Only Vilnius and Kaunas municipalities scored above the average on the Municipal Culture Index. Klaipėda Municipality's Culture Index score is close to the average. However, other municipalities in major cities significantly lag behind the average municipal culture index score.
5. The Municipal Culture Index offers an objective, quantitative perspective on the cultural situation in municipalities. With 40 indicators covering 60 municipalities, there are 2,400 situations that could be further discussed and analyzed in depth. Given the extensive scope of this study, it wouldn't be feasible to address all potential issues comprehensively. However, the hope is that cultural experts in each municipality can enhance the quantitative results with contextual knowledge and qualitative insights. By bridging the expertise of local professionals with the Municipal Culture Index indicators, it becomes possible to chart future directions and objectives for cultural development in each municipality.
6. The Municipal Culture Index can be utilized to monitor the cultural situation in municipalities. The Index serves as a tool to measure the outcomes of cultural policies, investments in culture, and other interventions aimed at activating the cultural environment.
7. The long-term vision of Lithuania 'Lithuania 2050' underscores the challenge of inequality. To address the issue of inequality in the cultural sector, the Lithuanian Council for Culture has incorporated a model of sustainable cultural development that allocates a portion of the quota to districts with a weaker social climate. Given the political context and the progressive nature of this provision, it is advisable to uphold the existing principles and explore additional measures that would mitigate cultural disparities among municipalities, particularly in areas with weaker social climate. As demonstrated by the 'Lithuania 2050' Strategy, reducing inequality remains a key objective for the next 30 years. Regrettably, the Municipal Culture Index reveals a

cultural gap among municipalities, posing a hindrance to the nation's cultural development.

8. Collaboration and leveraging cultural resources from neighboring, more robust municipalities could enhance Municipal Culture Index values and improve the overall cultural situation. Visaginas, for example, might benefit from strengthening ties with municipalities in its own county, such as Zarasai, Anykščiai, or Molėtai. Vilnius district could explore better utilization of its proximity to the capital. Alytus municipality could seek more connections with the resort municipality of Druskininkai, among other possibilities. Collaborative efforts could lead to larger cultural projects targeting a broader audience and facilitate the presentation of new artistic forms.
